KOTLIN MULTIPLATFORM

# Podcast *Player*

One shared Kotlin core. Two fully native user interfaces — Jetpack Compose on Android, SwiftUI on iOS — each built the way that platform's users already expect it.

**1** shared Kotlin core

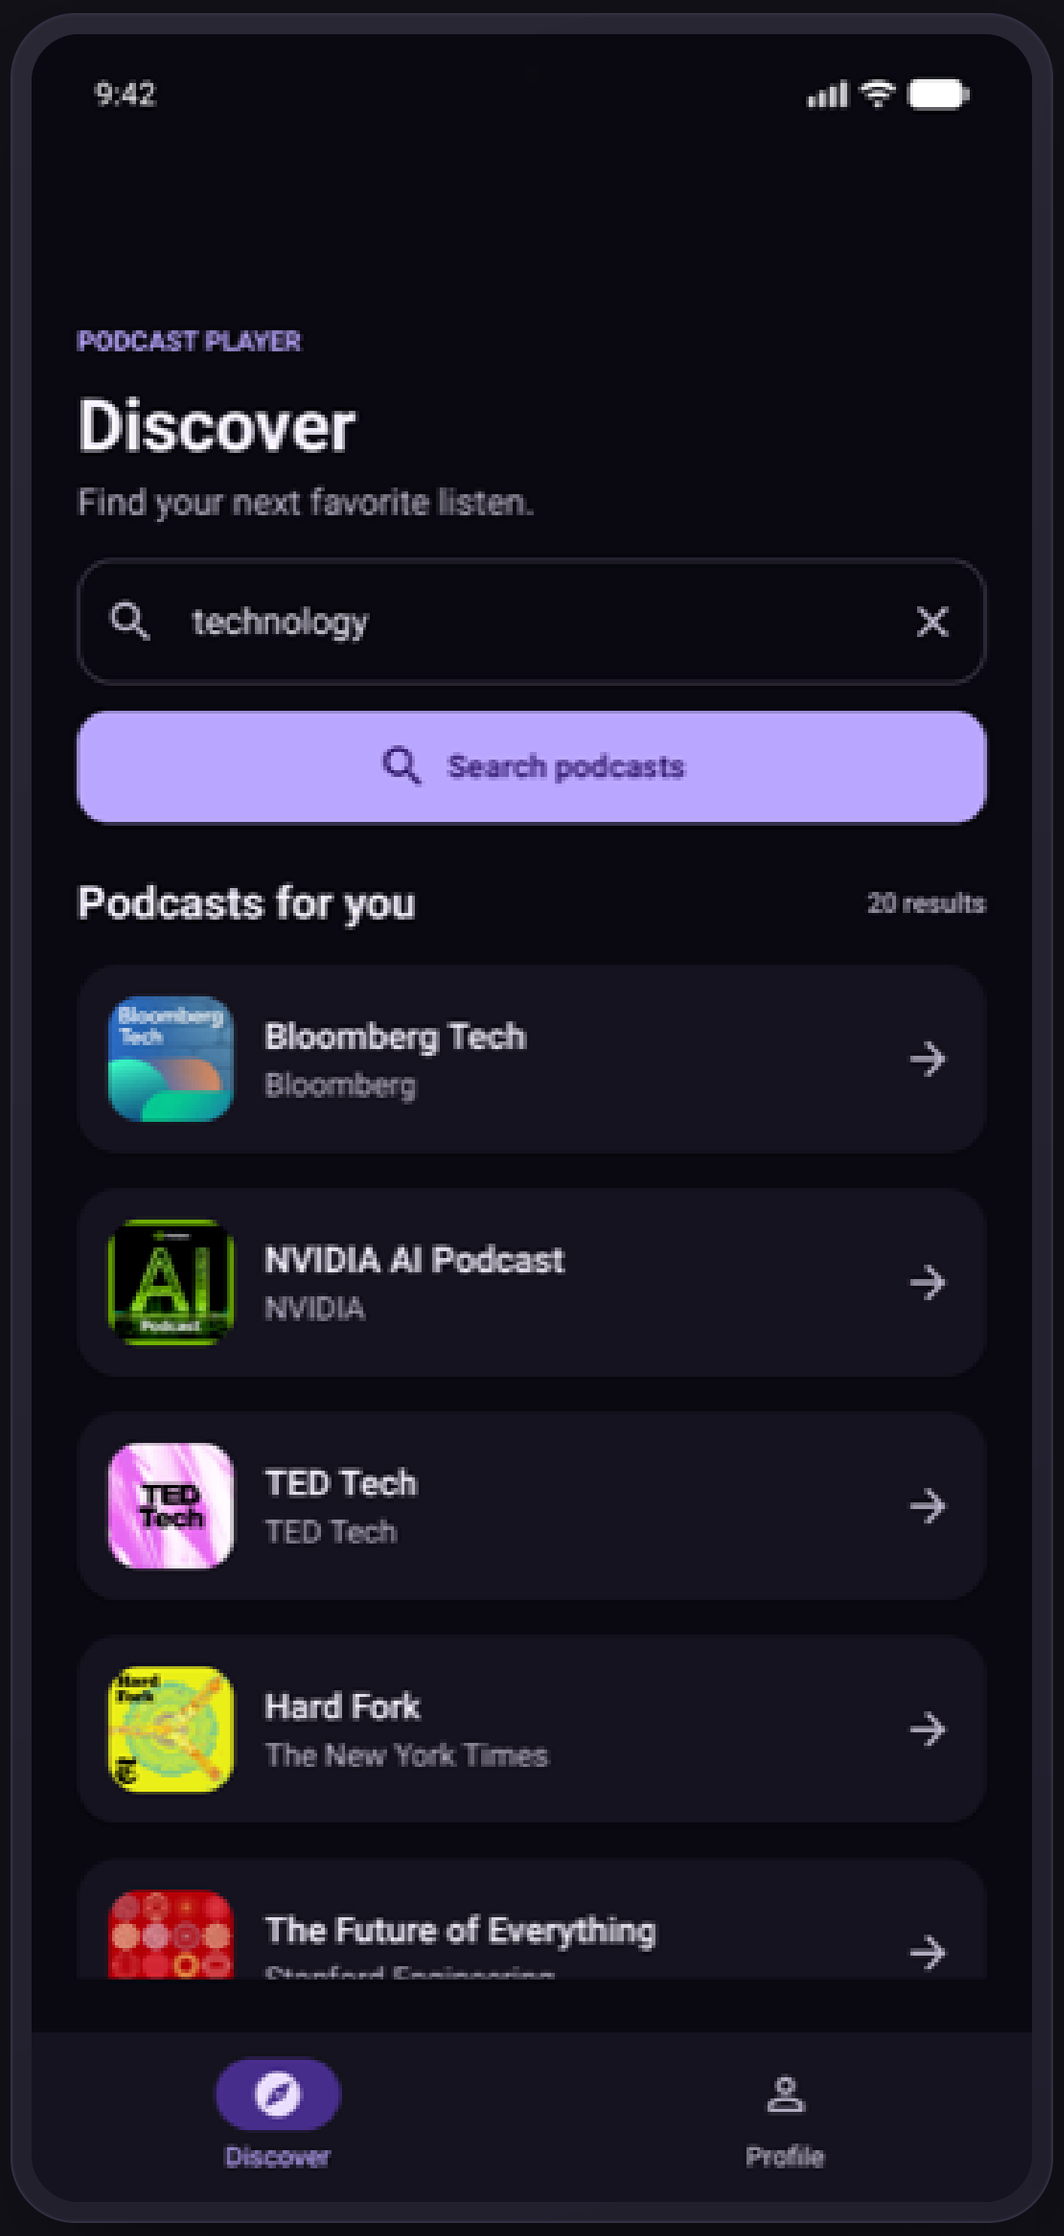

**2** native UI layers

**iTunes Search API** live podcast data

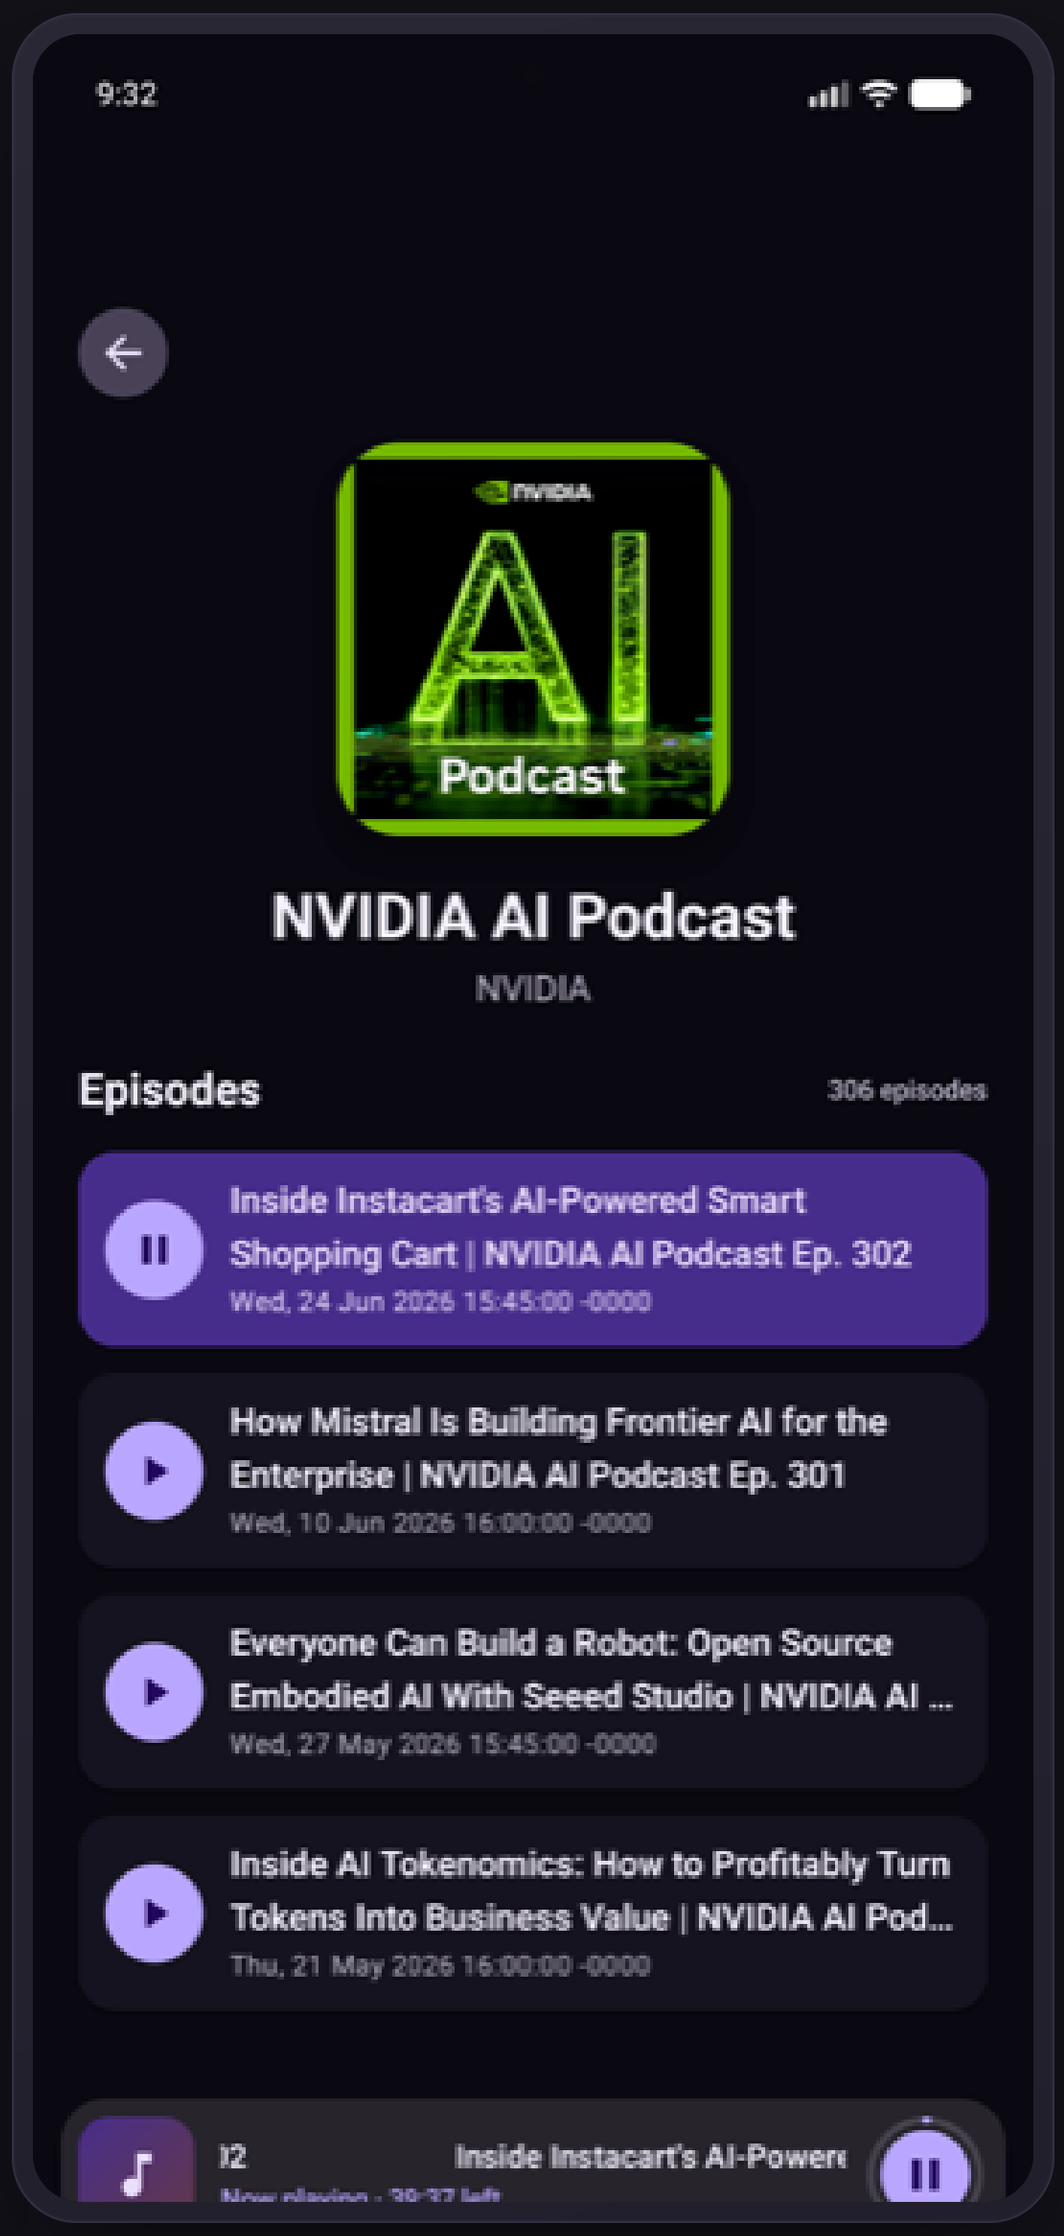

ANDROID

# *Jetpack Compose*

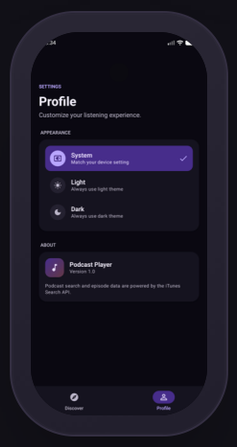

Material 3 theming, a shimmer-skeleton loading state, and a Media3 foreground service that keeps playback — and its system notification — alive after the app is closed.

EPISODES · NOW PLAYING

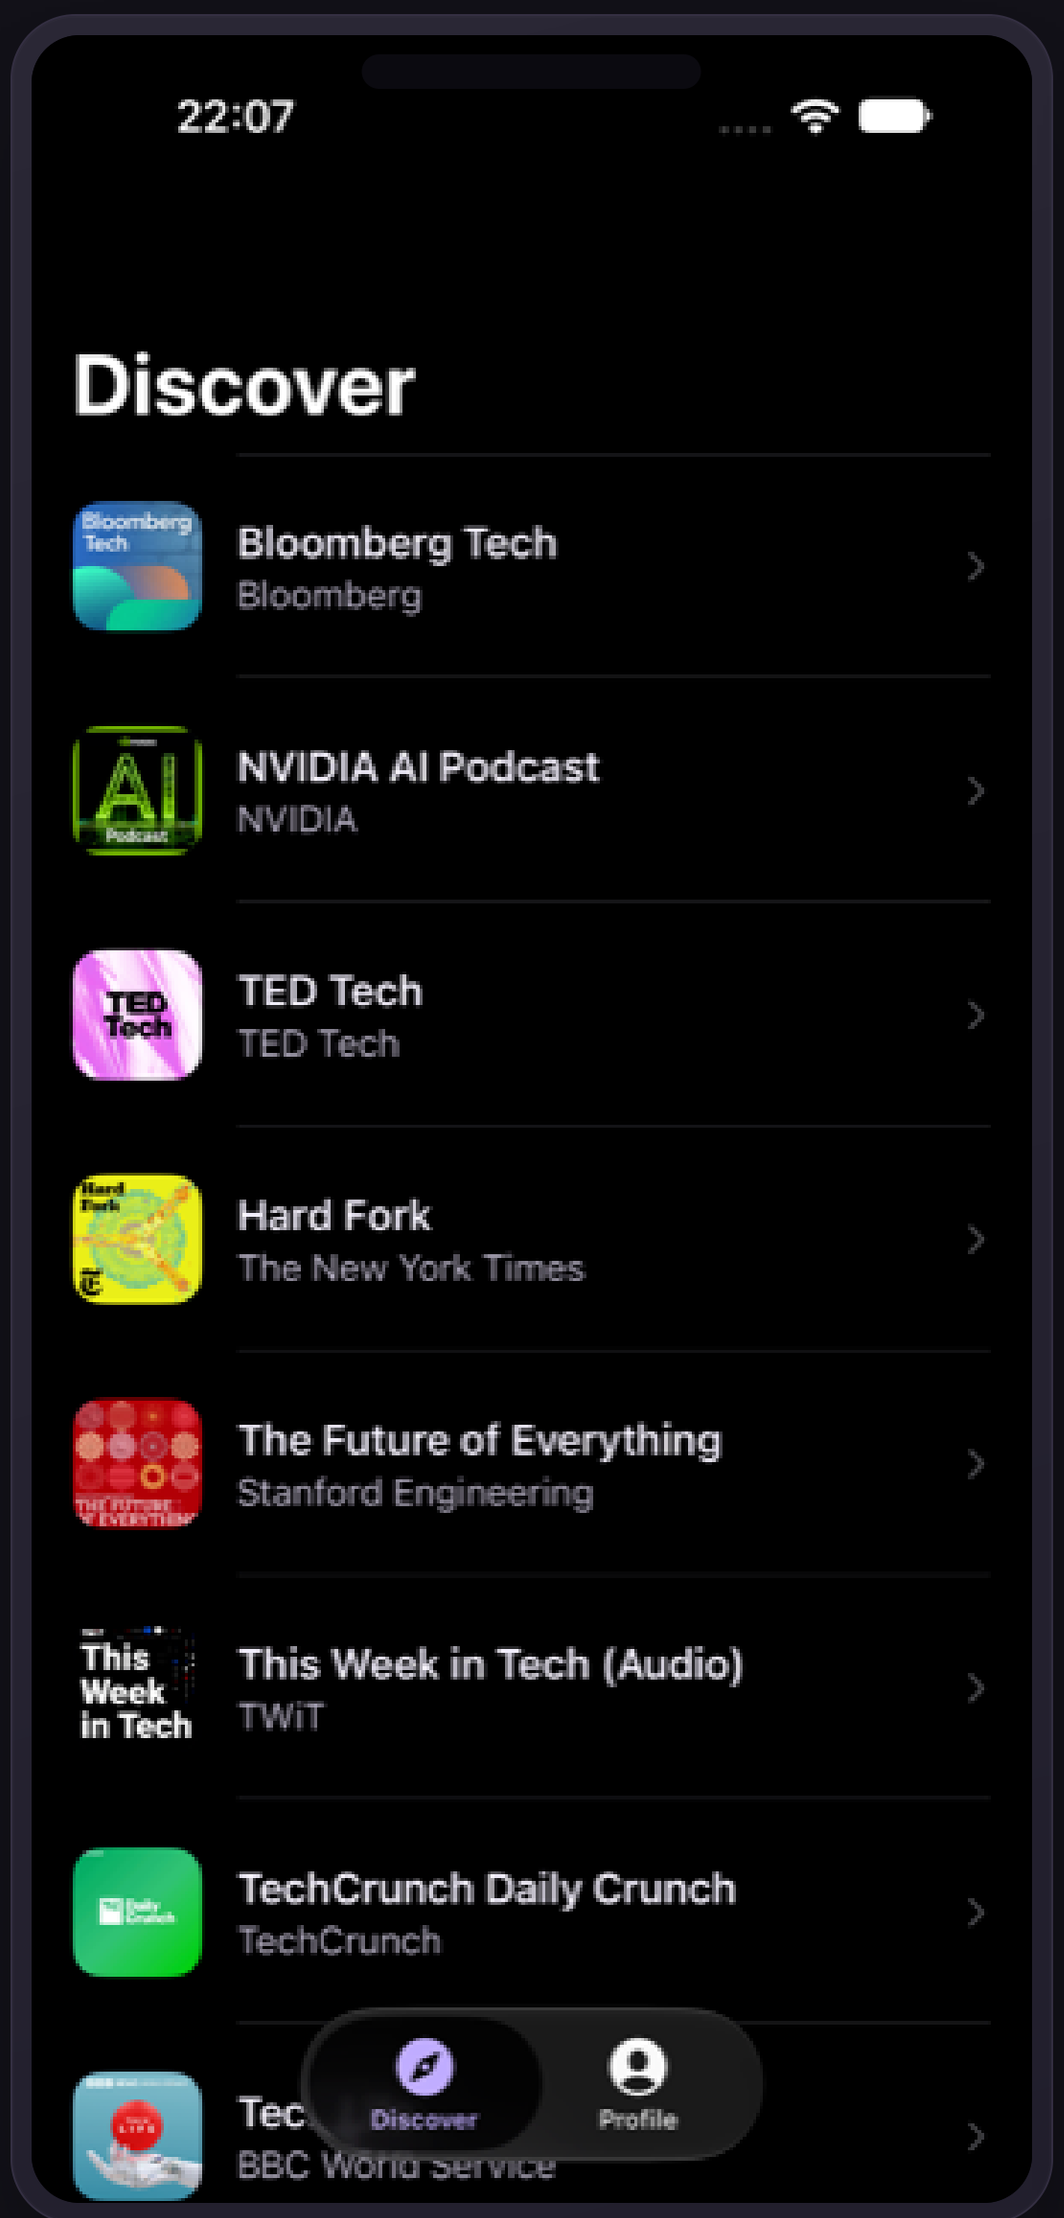

PROFILE · THEME

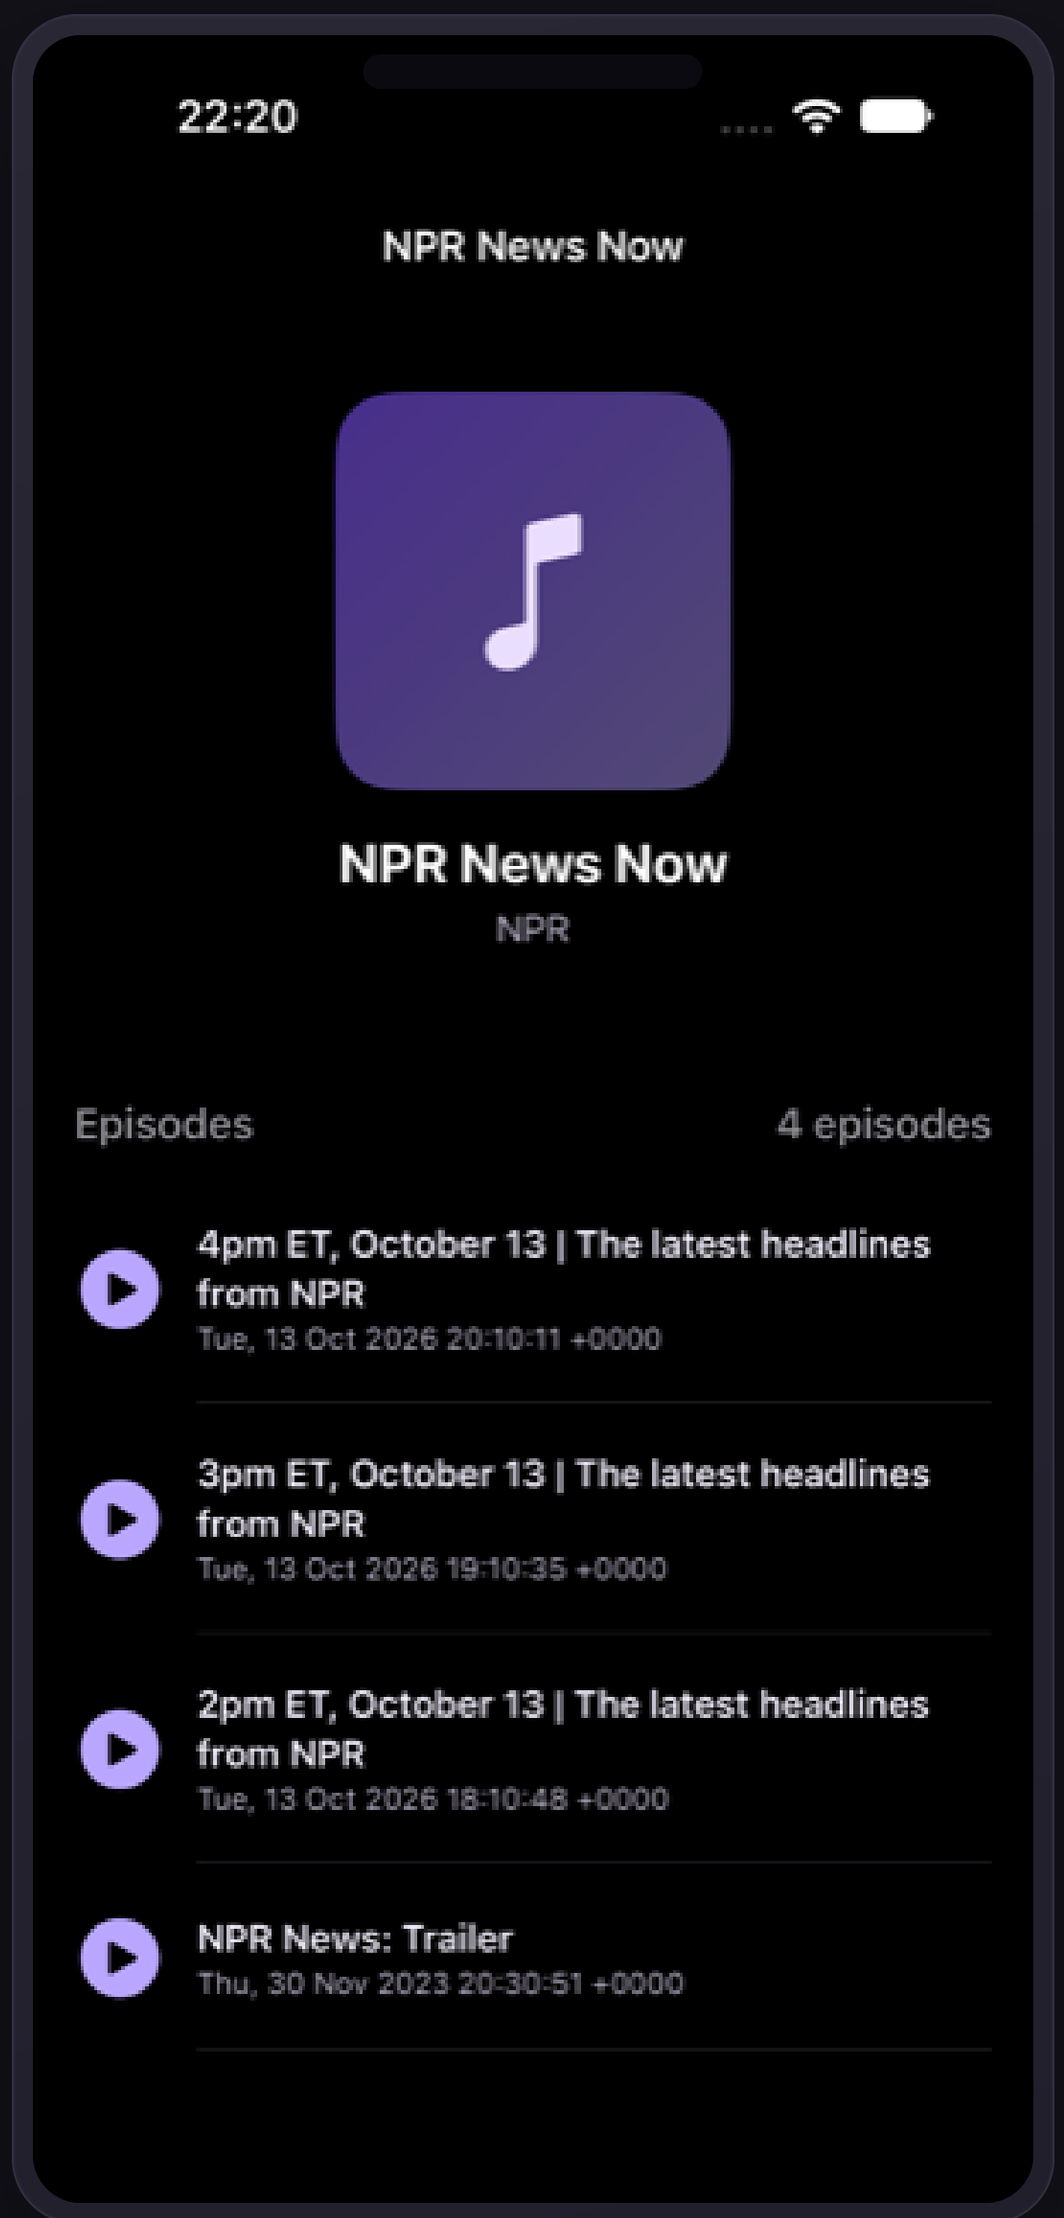

IOS

# *SwiftUI*

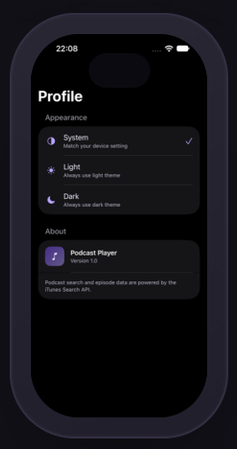

`NavigationStack`, `.searchable`, a native grouped Settings list, and an AVPlayer-backed player — not a port of the Compose screens.

PROJECT STRUCTURE

# One core, two native shells

Business logic — networking, search, RSS parsing, the view model — lives once in `sharedLogic` and compiles for both targets. Each platform owns its UI outright.

`sharedLogic/`

### Shared Kotlin core

Networking, repository, RSS parsing, PodcastViewModel — commonMain, compiles for Android & iOS.

Ktor · Koin · xmlutil · kotlinx.serialization

`androidApp/`

### Android — Jetpack Compose

Screens, navigation, theme, a Media3 `MediaSessionService` for background playback.

Compose · Media3 / ExoPlayer · DataStore

`iosApp/`

### iOS — SwiftUI

Native screens, theme ported to `Color` tokens, an AVPlayer-backed player.

SwiftUI · AVFoundation · UserDefaults

`sharedUI/` Compose Multiplatform scaffold from the project template — not used by either running app today.
